ABSTRACT:

An acousto-optic tunable filter (AOTF) is employed to generate a display by driving the AOTF with an RF electrical signal comprising modulated red, green, and blue video scan line signals and scanning the AOTF with a linearly polarized, pulsed light beam, resulting in encoding of color video columns (scan lines) of an input video image into vertical columns of the AOTF output beam. The AOTF is illuminated periodically as each acoustically-encoded scan line fills the cell aperture of the AOTF. A polarizing beam splitter removes the unused first order beam component of the AOTF output and, if desired, overlays a real world scene on the output plane. Resolutions as high as 30,000 lines are possible, providing holographic display capability.

ABSTRACT:

A computerized system provides a salesperson with assistance related to training and sales of parts corresponding to particular products. More particularly, a computerized system incorporating a data storage device, a display apparatus, a part selection device and a user interface mechanism enhances the efforts of a parts salesman. The data storage device electronically stores graphic and textual partsrelated information including specifications, features and customer benefits. The display apparatus electronically displays portions of the graphic and textual information in order to provide training and sales assistance related to part features and customer benefits. The part selection device electronically selects a particular part by navigating through part choices menus based on stored part specifications. The user interface mechanism controls the operation of the display apparatus and the part selection device parts so that each of the respective parts are operatively coupled and related to one another.

INT-CL (IPC): G02B 27/22
EUR-CL (EPC): G02B027/22

ABSTRACT:

A method and system for creating a three dimensional viewing illusion in true color uses left and right images of a stereo pair which are designed to be viewed respectively by the left and right eyes of a viewer as a single three dimensional image. In synchrony therewith, light from a light source device is alternately shown to the right and left eyes of the viewer so that while the eyes do view both of the left and right stereo images, the contrast of the eye receiving both the light and the stereo image designed for the other eye is reduced. In the various embodiments, the light source device includes a left and a right light source. In one embodiment the light sources are collimated and suitably aimed at the respective eyes. Preferably, the position of the eyes are also tracked and the aiming of the sources is adjusted as the viewer moves. In another embodiment, the light sources are mounted adjacent the associated eye of the viewer on an object which is worn by the viewer. In still another embodiment, the light sources are polarized differently. Then, mounted to an object worn by the viewer is a left light filter device for preventing polarized light from the right light source from being passed and hence received by the left eye and a right light filter device for preventing polarized light from the left light source from being passed and hence received by the right eye.

INT-CL (IPC): G06F 15/40
EUR-CL (EPC): G06F003/033; G06F003/033

ABSTRACT:

In a computer human interface an abstract, device-independent "picture" is capable of containing multi-application information. A picture comprises a number of abstract picture elements which can be arbitrarily combined. A particular application attributes meaning to a particular organization of picture elements. No one application need be aware of the existence of any other, nor is it affected by any other, even though several applications may be sharing the same picture. A single, cohesive visual image, incorporating information from various applications, is presented on a suitable output device, such as a video display unit. Images representing portions of any or all of the applications can be displayed and updated on the output device simultaneously and independently of one another. User interface interface information, such as menus, icons, prompts, and help text, is also contained in the picture and may be displayed simultaneously with the application image(s).

INT-CL (IPC): G06F 15/62
EUR-CL (EPC): G06F003/00; G06K011/08, G06K011/18

ABSTRACT:

A pointing device (28), comprising light sources (30) and monitored by a computer vision task running in a microcontroller (108) and a computer (24). The computer vision task computes the spatial position and orientation of the pointing device, and enables an operator to control virtual three dimensional objects (73) on the display (22) of the computer. Images (78) are captured by a video camera (20) and digitized, and only image rows that contain bright pixels (80) from the light sources are processed. The light sources are the tips of optic fibers (30) guiding light from a laser diode (32), and an optical filter (46) on the camera is matched to the wavelength of the laser diode.

ABSTRACT:

A method and apparatus for generating complex 3D stereo images in response to real time viewer head movement by dynamically accessing pairs of stereo images selected from among a precomputed set of images. The precomputed images correspond to a predetermined set of possible viewpoints, and are accessed based upon a prediction of viewer head movement. The arrangement of predetermined viewpoints may be along one, two, or three dimensions.

EUR-CL (EPC): G09B009/30; G09B009/30, G09B009/32 , G09B009/32

ABSTRACT:

A wrap-around display system for presenting out-the-window visual imagery in a flight simulator is disclosed. Eight identically pentagon-shaped translucent rear-projection screens are joined together at their edges to form a partial dodecahedron. Each video projector is mounted outside the partial dodecahedron to direct, through a mounted mirror-folded beam path, an appropriate simulator image to the rear of a pentagon screen. A simulator pilot views the simulated image from inside the partial dodecahedron. Also disclosed is an apparatus for switching eight video signals among six video channels by monitoring simulator head movement to switch video signals to the screen, or window, then being viewed. Further disclosed is an apparatus for providing geometrically correct separate images to two simulator crewmembers. Each field of an interlaced raster display is a display for a separate crewmember design eye-point. Two liquid crystal controlled glasses are worn one each by each crewmember. The glasses lens are separately switched on and off in synchronization with the two video fields so that each crewmember sees the geometrically correct view for his or her design eye-point.

ABSTRACT:

A panoramic image based virtual reality display system includes a panoramic optical assembly, preferably of substantially spherical coverage, feeding composite optical images to a light sensitive surface of a video camera for storage or further processing in image processing circuitry. Such image processing circuitry includes a special effects generator and image segment circuitry to divide a composite image into a plurality of image segments or sub-segments for display on individual displays of multiple video display assemblies. Such a multiple video display assembly preferably includes a closed structure having individual display units mounted in all viewable directions therein, with segments of the composite image displayed on respective display units to recreate the panoramic view gathered by the panoramic optical assembly. The image processing circuitry may also select a portion or portions of the composite image for display on one or two displays of a head mounted display unit.

BASIC-ABSTRACT:

A computerised system incorporating a data storage device, a display, a part selection device and a user interface enhances the efforts of a parts salesman. The data storage device electronically stores graphic and textual parts-related information including specifications, features and customer benefits. The display electronically displays portions of the graphic and textual information in order to provide training and sales assistance related to part features and customer benefits.

The part selection device electronically selects a particular part by navigating through part choices menus based on stored part specifications. The user interface mechanism controls the operation of the display and the part selection device so that each is coupled and related to the other.

ADVANTAGE - Single system is able to perform numerous functions e.g. train salesman, inform customer and gather information.

ABSTRACTED-PUB-NO: US 5365370A

BASIC-ABSTRACT:

A display is provided for displaying, alternately, left and right images of a stereo pair, which left and right images of the stereo pair are designed to be viewed by the left and right eyes of a viewer as a single three dimensional image. A light source shines, alternately, light to right and left eyes of the viewer synchronously with the displaying of the respective left and right images of the stereo pair so that while the eyes of the viewer do view both of the left and right stereo images, the contrast of the eye receiving both the light and the stereo image designed for the other eye is reduced.

The light source includes a left and a right collimated light source which are aimed at the respective left and right eyes of the viewer. The light source further includes a tracking unit for tracking the position of the eyes of the viewer and adjusting the aiming of the left and right light sources as the viewer moves.

USE - System for producing a three dimensional viewing illusion from a two-dimensional display.

ABSTRACT:

A group visualization system allowing users of a group, either at a local site or a remote site to view images personalized to each users specific needs. Each user of the team interactively selects personalize viewing parameters, such as portions of the model to be displayed and the angle to view the model. Each user may select an overlay map to be superimposed on the model and displayed in the same manner which the model is displayed. A user who is an electrical engineer may select a voltage overlay, which a mechanical engineer may select a stress/strain overlay of the same model. Each user may select the parameters specified by another user or users, either at the local site or a remote sites, to see what they are viewing. Each user has access to a pointer which allows each user to specify a location which a symbol is superimposed and is visible to selected users. This results in a tool allowing users of a group at various sites to act as a team interact with each other.
